USER SCENARIOS

Swan Paper Factory

1 Log Production Batch & Operator Notes

User Stories	#1 Log Production Batches | #27 Log Operator Notes on Batches

Role	**Machine Operator**
Scenario	The Machine Operator, a machine operator on the morning shift, wants to record the output of a completed production run and attach any relevant observations so there is a complete and traceable log of what was produced, on which machine, and when.

MAIN SEQUENCE

1.	The Machine Operator logs into the SPF-OMS platform using her operator credentials.
2.	She navigates to the 'Production Log' section from the dashboard.
3.	She selects the relevant machine from the registered machine list.
4.	She selects her shift (Morning / Afternoon / Night) and confirms her name as the operator.
5.	She enters the output quantity produced during the run.
6.	She sets the batch status: Complete, Partial, or Scrapped.
7.	The system validates that all required fields are filled in.
8.	The Machine Operator submits the production batch record.
9.	The system assigns a unique batch ID and timestamps the entry.
10.	A confirmation message is displayed and the batch appears in the production log.
11.	The Machine Operator selects 'Add Note' from the batch detail view.
12.	She enters a free-text note describing any unusual conditions or observations from the run.
13.	The Machine Operator submits the note. The system saves it linked to the batch, her name, and a timestamp.
14.	The note is immediately visible to any user viewing the batch record.

ALTERNATIVE SEQUENCE

- If a required field is left empty, the system highlights the field and prevents submission until corrected.
- If the selected machine is flagged as under maintenance, the system warns the Machine Operator before allowing her to proceed.
- If the batch status is Scrapped, the system prompts for a reason before saving.
- If the Machine Operator attempts to submit a blank note, the system prompts her to enter content before saving.
- The Machine Operator can edit her own note until the batch is closed; after closure, notes become read-only.

SPECIAL REQUIREMENTS

- Each batch must be linked to a specific machine, shift, and operator.
- Output quantity and status (Complete / Partial / Scrapped) must be captured.
- Batch ID and timestamp are generated automatically on submission.
- Each note must be linked to the batch, operator, and a timestamp.
- Notes must remain visible when reviewing batch history.

POST-CONDITION

POST-CONDITION The production batch is saved with a unique batch ID and any operator observations are attached, giving stakeholders a complete and contextual record of the production run.

2 Log Machine Downtime & Shift Handover

User Stories	#12 Log Machine Downtime | #15 Record Shift Handover Notes

Role	**Machine Operator**
Scenario	The Machine Operator wants to record a machine stoppage that occurred during her shift and leave a clear handover note for the incoming operator, so disruptions are documented and the next shift starts informed.

MAIN SEQUENCE

1.	The Machine Operator logs into SPF-OMS using her operator credentials.
2.	She navigates to the 'Machine Downtime' section from the dashboard.
3.	She selects the affected machine and confirms her current shift.
4.	She enters the start time and end time of the stoppage.
5.	She selects the reason for the stoppage (e.g. mechanical fault, material shortage).
6.	The Machine Operator submits the downtime record. The system saves it linked to the machine, shift, and operator.
7.	The downtime entry is immediately visible alongside the machine's production history.
8.	The Machine Operator then navigates to the 'Shift Handover' section.
9.	She selects her production line and confirms her outgoing shift.
10.	She enters a free-text handover note referencing the downtime and any unresolved items.
11.	The Machine Operator submits the note. The system saves it linked to the shift, line, and her operator profile.
12.	The note becomes visible to the operator assigned to the next shift on the same line at their login.

ALTERNATIVE SEQUENCE

- If the start or end time is left empty, the system prevents submission.
- If the end time is earlier than the start time, the system flags the conflict before saving.
- If the machine is already flagged as under maintenance, the system links the downtime entry to the active maintenance record.
- If the Machine Operator submits an empty handover note, the system prompts for content before saving.
- If no operator is assigned to the next shift, the note is saved and flagged as unread.
- The Machine Operator can edit the handover note until it is marked as read by the incoming operator.

SPECIAL REQUIREMENTS

- Each downtime entry must be linked to a machine, shift, operator, start time, end time, and reason.
- Downtime events must be visible alongside production data in the machine history view.
- The handover note must be linked to the shift, production line, and outgoing operator.
- The note must be visible to the operator assigned to the next shift on the same line.

POST-CONDITION

POST-CONDITION The downtime event is fully documented and the incoming operator receives a clear handover note, ensuring continuity and a complete record of shift disruptions.

3 Review Machine Output History & Batch Traceability

User Stories	#10 Review Machine Output History | #11 Track Batches

Role	**Machine Operator**
Scenario	The Machine Operator wants to review the production history for a specific machine to spot output trends, and then trace a specific batch back to its raw material source to support a quality investigation.

MAIN SEQUENCE

1.	The Machine Operator logs into SPF-OMS and navigates to the 'Machine History' section.
2.	She selects a machine from the registered machine list.
3.	The system displays a chronological log of production batches, showing shift, operator, output quantity, batch status, and date.
4.	Any logged downtime events are displayed alongside the production entries.
5.	The Machine Operator filters the history by date range to focus on a period of concern.
6.	She identifies a batch with an unusually low output and notes its batch ID.
7.	She navigates to the 'Batch Traceability' section and enters the batch ID.
8.	The system retrieves and displays the full production history for that batch.
9.	The Machine Operator reviews the linked raw material lot, machine, and shift details.
10.	She follows the chain back to the original raw material receipt record.
11.	The Machine Operator exports the traceability report for the selected batch.

ALTERNATIVE SEQUENCE

- If no production data exists for the selected machine, the system displays an empty state message.
- If the batch ID does not exist, the system displays an error and prompts the Machine Operator to re-enter.
- If any part of the traceability chain is incomplete, the system highlights the gap.
- If multiple raw material lots contributed to a single batch, all are displayed.
- If a downtime event was not logged at the time, a supervisor can add a retrospective entry.

SPECIAL REQUIREMENTS

- Output per shift per machine must be displayed in chronological order with downtime events visible.
- History must be filterable by date range or shift.
- Each finished batch must be linked to the raw material lot, machine, and shift used.
- The full production history must be retrievable using a batch ID.

POST-CONDITION

POST-CONDITION The Machine Operator has identified the underperforming batch, traced it to its raw material and shift source, and exported the traceability report to support the quality investigation.

4 View Personal Shift Assignments

User Stories	#24 View Personal Shift Assignments

Role	**Machine Operator**
Scenario	The Machine Operator wants to check her upcoming shift assignments and production line allocations so she knows when and where she is expected to work for the week ahead.

MAIN SEQUENCE

1.	The Machine Operator logs into SPF-OMS using her operator credentials.
2.	The dashboard displays a summary of her upcoming shift assignments.
3.	She navigates to the 'My Shifts' section for a full weekly schedule view.
4.	The system displays each assignment with the date, time block, role, and production line.
5.	The Machine Operator reviews the schedule for the coming week.
6.	Any assignments that have been updated since her last login are highlighted.

ALTERNATIVE SEQUENCE

- If the Machine Operator has no upcoming shifts assigned, the system displays a message indicating no assignments are scheduled.
- If a shift is modified or cancelled after the Machine Operator has viewed it, the system flags the change at next login.
- The Machine Operator cannot edit her own shift assignments; changes must be made by the owner.

SPECIAL REQUIREMENTS

- The shift view must show date, time block, role, and production line per assignment.
- Updated assignments must be flagged to the operator at next login.

POST-CONDITION

POST-CONDITION The Machine Operator has a clear and up-to-date view of all upcoming shift assignments, including any recent changes, so she can plan accordingly.

5 Raise and Approve Purchase Orders

User Stories	#5 Raise Purchase Orders to Suppliers | #20 Approve Purchase Orders Before Dispatch

Role	**Founder / Owner**
Scenario	The Owner wants to raise a purchase order for raw materials and move it through the approval process before it is dispatched to the supplier, ensuring he retains full control over procurement spending.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Purchase Orders' section.
2.	He clicks 'New PO' and selects the supplier from the registered supplier list.
3.	He selects the material type and enters the required quantity.
4.	He sets the expected delivery date and reviews the order summary.
5.	The Owner confirms submission. The system saves the PO and sets its status to Pending Approval.
6.	The Owner filters the PO list by Pending Approval to locate the new order.
7.	He opens it, reviews all details, and clicks Approve.
8.	The system updates the status to Approved and the PO is ready for dispatch to the supplier.
9.	If the Owner rejects the order instead, he enters a reason and the order is returned for revision.
10.	When materials arrive, the Owner opens the approved PO and logs the received quantity.
11.	The system updates the PO status and adjusts inventory levels accordingly.
12.	If only part of the order arrives, the system records a partial receipt and marks the remainder as outstanding.

ALTERNATIVE SEQUENCE

- If the supplier is not yet registered, the Owner can add a new supplier before creating the PO.
- If the received quantity exceeds the ordered quantity, the system warns before allowing confirmation.
- If the expected delivery date passes without a receipt, the system flags the PO as overdue.
- If a PO is edited after approval, its status reverts to Pending Approval and re-approval is required.
- If the approving user does not have the Authorised Approver role, the system prevents the action.
- If an order is approved in error, the Owner can revoke approval provided it has not yet been dispatched.

SPECIAL REQUIREMENTS

- Each PO must be linked to a supplier, material type, quantity, and expected delivery date.
- POs must be set to Pending Approval on creation; only authorised users can approve.
- Rejected orders must be returned for revision with a documented reason.
- Received quantity must be logged on arrival; partial receipts must be supported.

POST-CONDITION

POST-CONDITION The purchase order has been raised, reviewed, approved, and dispatched to the supplier, with inventory updated on receipt and full control over unauthorised spending maintained.

6 Receive Raw Materials & Set Reorder Quantities

User Stories	#13 Record Raw Material Receipts | #22 Set Reorder Quantities per Material

Role	**Founder / Owner**
Scenario	The Owner wants to log an incoming raw material delivery against the relevant purchase order and set a standard reorder quantity for that material, so future orders can be raised quickly and stock stays accurate.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Raw Material Receipts' section.
2.	He selects the relevant purchase order from the open PO list.
3.	The system pre-fills the supplier, material type, and expected quantity from the PO.
4.	The Owner confirms or adjusts the received quantity and enters the arrival date.
5.	He confirms submission. The system updates inventory and marks the PO as fully or partially fulfilled.
6.	The Owner then navigates to 'Inventory Settings' and selects the same raw material.
7.	He enters the standard reorder quantity for that material and confirms the minimum threshold is also set.
8.	The Owner saves the settings. The reorder quantity is stored alongside the threshold.
9.	The next time a purchase order is created for that material, the quantity is pre-filled automatically.
10.	The Owner can override the pre-filled quantity if a different amount is needed on any given order.

ALTERNATIVE SEQUENCE

- If the received quantity is less than ordered, the system records a partial receipt and marks the remainder as outstanding.
- If the received quantity exceeds the ordered quantity, the system warns the Owner before allowing confirmation.
- If there is no matching PO, the Owner can log a standalone receipt and link it to the supplier manually.
- If the reorder quantity is set to zero, the system flags it as invalid.
- Changes to the reorder quantity apply to future purchase orders only.

SPECIAL REQUIREMENTS

- Each receipt must be linked to a supplier, material type, quantity, and arrival date.
- Inventory must be updated automatically after the receipt is confirmed.
- Reorder quantity must be stored per material and pre-filled on new purchase orders.
- The pre-filled quantity must be overrideable at the point of order creation.

POST-CONDITION

POST-CONDITION The raw material delivery is logged, inventory is updated, and the reorder quantity is configured so future procurement for that material is faster and more consistent.

7 Review Supplier Performance

User Stories	#19 Review Supplier Performance

Role	**Founder / Owner**
Scenario	The Owner wants to review the delivery history for a key supplier so he can identify recurring delays or shortfalls and decide whether to continue relying on them for critical raw materials.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Suppliers' section.
2.	He selects the supplier from the registered supplier list.
3.	The system displays the supplier's full delivery history, showing each purchase order with its ordered quantity, received quantity, and delivery date.
4.	The Owner reviews entries and identifies any late or partial deliveries.
5.	He filters the history by date range to focus on the past quarter.
6.	The Owner adds a note to the supplier record documenting his performance concerns.

ALTERNATIVE SEQUENCE

- If the supplier has no delivery history yet, the system displays an empty state message.
- If a PO was cancelled before delivery, it is excluded from performance calculations but remains visible in history.
- If the supplier has multiple material types on record, the history can be filtered per material.

SPECIAL REQUIREMENTS

- Supplier history must show ordered quantity, received quantity, and delivery date per order.
- Late and partial deliveries must be clearly visible.
- History must be filterable by date range.

POST-CONDITION

POST-CONDITION The Owner has a clear, data-backed view of the supplier's reliability and has documented his concerns in the supplier record, enabling an informed reordering decision.

8 Track Inventory Levels & Low Stock Alerts

User Stories	#2 Track Inventory Levels | #9 Receive Low Stock Alerts

Role	**Founder / Owner**
Scenario	The Owner wants to check current stock levels across all materials and finished goods, configure minimum thresholds, and ensure he is automatically alerted before any item causes a production disruption.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Inventory' section.
2.	The system displays all raw materials and finished product types with their current stock counts.
3.	Items below their configured minimum threshold are highlighted with a low-stock flag.
4.	The Owner selects a specific material to view its detailed stock history, including incoming, outgoing, and current movements.
5.	The Owner then navigates to 'Inventory Settings'.
6.	He selects a material and sets its minimum stock threshold.
7.	The system saves the threshold against that item.
8.	The next time a stock movement causes that item to fall below threshold, the system generates an alert.
9.	The alert is logged and displayed as a notification on the Owner's dashboard at next login.
10.	The Owner reviews the alert and decides whether to raise a purchase order.

ALTERNATIVE SEQUENCE

- If stock data has not been updated recently, the system displays a stale data warning.
- If a new material has been added without a threshold, the system prompts the Owner to configure one.
- If the Owner has not configured a threshold for an item, no alert is generated for that item.
- If multiple items fall below threshold simultaneously, each generates a separate alert entry.

SPECIAL REQUIREMENTS

- Live stock count must be displayed per material and finished product type.
- A low-stock flag must be triggered automatically when quantity falls below the configured minimum.
- Minimum stock thresholds must be configurable per item.
- Alerts must be logged and visible on the owner's dashboard at next login.

POST-CONDITION

POST-CONDITION The Owner has full visibility of current stock levels, all thresholds are configured, and he will be automatically notified of any item approaching shortage before it disrupts production.

9 Allocate Raw Materials to Production Batches

User Stories	#14 Allocate Raw Materials to Production Batches

Role	**Founder / Owner**
Scenario	The Owner wants to reserve raw material stock against an upcoming production batch so the same stock cannot be committed to two jobs at the same time.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Production Batches' section.
2.	He creates a new production batch or opens an existing one in draft status.
3.	He selects the material type required for the batch and enters the quantity to allocate.
4.	The system checks available stock and confirms the requested quantity is available.
5.	The Owner confirms the allocation.
6.	The system reserves the quantity against the batch and reduces the available stock count immediately.
7.	The allocation is visible in both the batch record and the inventory view.

ALTERNATIVE SEQUENCE

- If available stock is insufficient, the system warns the Owner and prevents the allocation from being saved.
- If the production batch is cancelled, the system releases the reserved stock back to available inventory.
- If the same material is needed for multiple batches, each allocation is tracked separately.

SPECIAL REQUIREMENTS

- Each allocation must be linked to a batch, material type, and quantity reserved.
- Available stock count must be reduced immediately upon allocation.
- Allocations must be visible in both the batch record and the inventory view.

POST-CONDITION

POST-CONDITION The raw material quantity is reserved against the production batch, available stock is updated, and double-allocation of the same stock is prevented.

10 Export Inventory Snapshot

User Stories	#29 Export Inventory Snapshot

Role	**Founder / Owner**
Scenario	The Owner wants to download a point-in-time snapshot of all stock levels to share with his accountant at the end of the month, without granting them direct access to SPF-OMS.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Inventory' section.
2.	He selects 'Export Snapshot' and sets the snapshot date (defaulting to today).
3.	The system compiles inventory data as at the selected date.
4.	The Owner reviews the scope of the export (all materials and finished goods).
5.	He optionally filters the export by material type.
6.	He clicks Download to generate the file.
7.	The system produces a CSV and makes it available for immediate download.
8.	The file includes material name, unit of measure, current quantity, and low-stock status for each item.

ALTERNATIVE SEQUENCE

- If no inventory data exists for the selected snapshot date, the system notifies the Owner and suggests the nearest valid date.
- If the export is taking longer than expected due to data volume, the system displays a progress indicator.
- The Owner can filter the export by material type or product category before downloading.

SPECIAL REQUIREMENTS

- The export must include material name, unit of measure, current quantity, and low-stock status.
- The export must be available as a CSV download.
- The snapshot must be filterable by date.

POST-CONDITION

POST-CONDITION The Owner has downloaded an accurate CSV snapshot of all stock levels as at the selected date, ready to share with external parties without requiring them to access the system.

11 Manage Client Accounts & Create Sales Orders

User Stories	#28 Manage Client Accounts | #3 Manage Sales Orders

Role	**Founder / Owner**
Scenario	The Owner wants to add a new retail partner to the system and immediately raise a sales order for them, so the client is on record and the order is tracked from the moment it is placed.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Clients' section.
2.	He clicks 'New Client' and enters the client's name, contact details, and account type.
3.	The Owner saves the record. The system creates the client account.
4.	The Owner navigates to 'Sales Orders' and clicks 'New Order'.
5.	He selects the newly created client from the registered client list.
6.	He selects the product type, enters the required quantity, and sets the requested delivery date.
7.	The system validates stock availability for the requested quantity.
8.	The Owner confirms and submits the order.
9.	The system creates the order record with status Pending and links it to the client.
10.	The order is visible in the order management table and progresses through: Pending > Processing > Packed > Dispatched > Delivered.
11.	All orders linked to this client are accessible within the client's record.

ALTERNATIVE SEQUENCE

- If a client with the same name already exists, the system warns the Owner of the potential duplicate.
- If required contact fields are left blank, the system prevents submission.
- If insufficient stock is available, the system warns the Owner before allowing order confirmation.
- If the delivery date is in the past, the system flags it as invalid.
- The Owner can manually update the order status at any stage.
- If a client account is marked as inactive, it is excluded from the selection list but accessible in the archive.

SPECIAL REQUIREMENTS

- Each client record must store name, contact details, and account type.
- Client records must be linked to all associated sales orders.
- Each order must be linked to a client, product, quantity, and requested delivery date.
- Order status must progress through: Pending, Processing, Packed, Dispatched, Delivered.

POST-CONDITION

POST-CONDITION The new client is on record, the sales order is created and linked to them, and both are actively tracked in the system.

12 Assign Finished Goods Stock to Sales Orders

User Stories	#23 Assign Products to Sales Orders from Finished Goods Stock

Role	**Founder / Owner**
Scenario	The Owner wants to commit specific finished goods batches to a sales order so he knows exactly which stock has been reserved for each customer and available inventory stays accurate.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Sales Orders' section.
2.	He opens a sales order with status Processing.
3.	He selects 'Allocate Stock'. The system displays available finished goods batches for the required product type.
4.	The Owner selects the batch or batches to assign to the order.
5.	The system confirms the allocated quantity matches the order requirement.
6.	The Owner confirms. The system links the batch to the sales order line and reduces available stock immediately.
7.	The allocated batches are visible in both the sales order record and the finished goods inventory.

ALTERNATIVE SEQUENCE

- If available stock is insufficient to fulfil the full order, the system warns the Owner and allows partial allocation.
- If a batch has already been fully allocated to another order, it is excluded from the available selection.
- If the allocation is reversed due to cancellation, the system returns the stock to available inventory.

SPECIAL REQUIREMENTS

- Each allocation must link a finished goods batch to a sales order line.
- Available stock count must be updated immediately on allocation.
- Allocations must be visible in both the sales order and the finished goods inventory view.

POST-CONDITION

POST-CONDITION The finished goods batch is committed to the sales order, available inventory is reduced, and the Owner has full visibility of which stock is assigned to which customer.

13 Record Returned Goods

User Stories	#25 Record Returned Goods

Role	**Founder / Owner**
Scenario	The Owner wants to log a return from a retail partner whose delivery arrived damaged, so inventory is corrected and the return is traceable against the original order.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Returns' section.
2.	He clicks 'New Return' and selects the originating sales order.
3.	The system pre-fills the client, product, and original quantity from the order.
4.	The Owner enters the quantity being returned and selects the reason (e.g. damaged in transit).
5.	The Owner confirms and submits the return record.
6.	If the goods are usable, the system adds the returned quantity back to available stock.
7.	If the goods are damaged, the Owner selects 'Scrap' and the system logs them as scrapped.
8.	The return is linked to the original order and visible in the client's order history.

ALTERNATIVE SEQUENCE

- If the return quantity exceeds the original order quantity, the system prevents submission.
- If a return is logged against an order already fully returned, the system warns the Owner before saving.
- Scrapped items must be logged separately and must not be added back to available stock.

SPECIAL REQUIREMENTS

- Each return record must be linked to the originating order, product, quantity, and reason.
- Inventory must be adjusted after the return is confirmed.
- Returns must be visible in the client's order history.

POST-CONDITION

POST-CONDITION The return is recorded, inventory is corrected, and the Owner can track return patterns by client or product over time.

14 View Packing Queue & Pack Orders

User Stories	#7 View Packing Queue

Role	**Packaging Worker**
Scenario	The Packaging Worker, a packaging worker, wants to see which orders are ready to be packed in priority order so she can work efficiently and avoid dispatching incorrect items.

MAIN SEQUENCE

1.	The Packaging Worker logs into SPF-OMS using her packaging worker credentials.
2.	She navigates to the 'Packing Queue' section.
3.	The system displays all orders awaiting packing, sorted by dispatch date (earliest first).
4.	Each queue entry shows the product type and quantity per order.
5.	The Packaging Worker picks the next order from the queue and begins packing.
6.	Once complete, she marks the order as Packed within the system.
7.	The system updates the order status to Packed and triggers a notification to the assigned driver.

ALTERNATIVE SEQUENCE

- If an order has been modified since it entered the queue, the system highlights the change before the Packaging Worker confirms packing.
- If the Packaging Worker cannot pack an order (e.g. missing materials), she can flag it for review without marking it as packed.

SPECIAL REQUIREMENTS

- Queue must be sorted by dispatch date with product type and quantity shown per order.
- Marking an order as packed must update its status and trigger a driver notification.

POST-CONDITION

POST-CONDITION The Packaging Worker has packed all queued orders in priority order, statuses are updated, and the assigned driver is notified that loads are ready.

15 Track Finished Goods by Location

User Stories	#16 Track Finished Goods by Location

Role	**Founder / Owner**
Scenario	The Owner wants to record where each finished goods batch is stored in the warehouse so that stock can be located quickly when preparing orders for dispatch.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Finished Goods' section.
2.	He selects a completed production batch from the list.
3.	He assigns a warehouse location to the batch (e.g. bay reference, shelf, or zone code).
4.	The system saves the location against the batch record.
5.	The Owner searches for stock by product type or batch ID to verify the assigned location.
6.	When a batch is picked against a sales order, its location is displayed to assist warehouse staff.
7.	If a batch is moved, the Owner updates the location record and the system logs the change with a timestamp.

ALTERNATIVE SEQUENCE

- If a location code does not match any registered warehouse zone, the system warns the Owner before saving.
- If a batch has been fully dispatched, its location record is archived rather than deleted.
- Location updates must be logged with a timestamp.

SPECIAL REQUIREMENTS

- Each finished goods batch must be assigned a warehouse location on completion.
- Location must be searchable by product type or batch ID.
- Location changes must be logged with a timestamp.

POST-CONDITION

POST-CONDITION All finished goods batches are assigned a warehouse location, enabling staff to find and pick stock quickly and accurately when preparing dispatch.

16 View and Complete Delivery Manifest

User Stories	#4 View Delivery Manifests

Role	**Driver**
Scenario	The Driver, a delivery driver, wants to view his delivery schedule and load list for the day so he can complete all drops correctly and confirm each delivery in the system.

MAIN SEQUENCE

1.	The Driver logs into SPF-OMS using his driver credentials.
2.	He navigates to the 'Delivery Manifest' section.
3.	The system displays all orders assigned to the Driver for the current day.
4.	Each manifest entry shows the client name, delivery address, and list of items per order.
5.	The Driver reviews the full manifest before departing.
6.	After completing each delivery, he marks the order as Delivered within the system.
7.	If there are issues at the delivery point (e.g. refused, partial, damage), the Driver adds a note.
8.	The system updates the order status to Delivered and logs the confirmation against the order.

ALTERNATIVE SEQUENCE

- If an order is modified after the manifest is generated, the system highlights the change for the Driver.
- If the Driver cannot complete a delivery, he can flag it as attempted and leave a note for the dispatcher.

SPECIAL REQUIREMENTS

- Manifest must show client name, delivery address, and items per order.
- Driver must be able to log delivery confirmation and note any issues.

POST-CONDITION

POST-CONDITION The Driver has completed his deliveries and all confirmations are logged in the system against the relevant orders.

17 Resolve Delivery Issues

User Stories	#30 View Unresolved Delivery Issues

Role	**Founder / Owner**
Scenario	The Owner wants to review all deliveries where the Driver has flagged a problem and resolve each one so that client disputes are closed and a resolution record is retained.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Delivery Issues' section.
2.	The system displays a list of all deliveries where the driver has flagged a problem.
3.	Each entry shows the order reference, client name, driver note, and date the issue was flagged.
4.	The Owner reviews the list and identifies issues requiring follow-up.
5.	He selects an issue to view the full delivery detail and the Driver's note.
6.	The Owner contacts the client to resolve the dispute.
7.	Once resolved, the Owner marks the issue as Resolved and enters a closing note.
8.	The system records the resolution date and note and archives the issue.

ALTERNATIVE SEQUENCE

- If no unresolved issues exist, the system displays a message confirming no open issues.
- The Owner can filter the list by date range or client.
- If an issue is marked as resolved in error, the Owner can reopen it.
- Resolved issues remain accessible in archived state for audit purposes.

SPECIAL REQUIREMENTS

- The issues list must show order reference, client name, driver note, and date flagged.
- Issues must be markable as Resolved with a closing note.
- Resolved issues must be archived and remain accessible.

POST-CONDITION

POST-CONDITION All flagged delivery issues are visible in one place, the Owner has resolved each one, and a full record of the resolution is retained against the original delivery.

18 Log Quality Inspections & Schedule Machine Maintenance

User Stories	#17 Log Quality Inspection Results | #18 Schedule Machine Maintenance

Role	**Founder / Owner**
Scenario	The Owner wants to record the quality inspection result for a production batch and, following a failed inspection, schedule a maintenance check on the machine that produced it.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Quality Inspections' section.
2.	He selects the production batch to be inspected.
3.	He enters the inspection date, confirms the inspector's name, and selects the result: Pass or Fail.
4.	The result is Fail. the Owner enters notes describing the defect type and extent.
5.	The Owner submits the inspection record. The batch is flagged in the finished goods list.
6.	The Owner navigates to the 'Machine Maintenance' section.
7.	He selects the machine that produced the failed batch.
8.	He clicks 'Schedule Maintenance', selects the maintenance type, and sets the scheduled date.
9.	The Owner saves the record. The system displays the entry with status Pending.
10.	When maintenance is completed, the Owner opens the record and marks it as Completed.
11.	Overdue maintenance records are flagged automatically by the system.

ALTERNATIVE SEQUENCE

- If an inspection result is submitted without selecting Pass or Fail, the system prevents submission.
- If a Fail result is submitted without defect notes, the system prompts for a description.
- A batch can have more than one inspection record if re-inspection is required.
- If a machine already has a pending maintenance record, the system notifies the Owner before allowing a new one.
- If the scheduled maintenance date is in the past, the system flags the entry as overdue immediately.

SPECIAL REQUIREMENTS

- Each inspection record must be linked to a batch, date, and result; failed inspections must include defect notes.
- Failed batches must be flagged in the finished goods list.
- Each maintenance record must store the machine, maintenance type, and scheduled date.
- The system must display Pending, Completed, or Overdue status for each maintenance entry.

POST-CONDITION

POST-CONDITION The failed batch is flagged with a full inspection record, and a maintenance check is scheduled for the responsible machine, reducing the risk of further quality failures.

19 Schedule Workforce Shifts

User Stories	#6 Schedule Workforce Shifts

Role	**Founder / Owner**
Scenario	The Owner wants to assign staff members to production line shifts for the upcoming week so every line is covered and scheduling conflicts are avoided before the week begins.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Shift Schedule' section.
2.	He selects the production line and the time block (Morning, Afternoon, or Night).
3.	He selects an employee from the active staff list and assigns them a role for that shift.
4.	The system checks for double-assignment conflicts before saving.
5.	If no conflict exists, the shift assignment is saved and displayed in the weekly schedule.
6.	The Owner repeats the process for all lines and shifts for the week.
7.	Staff members can view their assigned shifts when they next log in.

ALTERNATIVE SEQUENCE

- If an employee is already assigned to a conflicting shift, the system blocks the save and highlights the conflict.
- The Owner can remove or reassign a shift at any point before the shift begins.

SPECIAL REQUIREMENTS

- Each shift assignment must record the role, employee, production line, and time block.
- The system must flag double-assignment conflicts before allowing the save.

POST-CONDITION

POST-CONDITION All production line shifts for the week are staffed, conflicts are resolved, and the schedule is visible to all relevant users.

20 Review Operational Performance

User Stories	#8 Generate Operational Reports | #21 View Production Line Utilisation | #26 View Daily Production Summary

Role	**Founder / Owner**
Scenario	The Owner wants to review the factory's overall performance for the past month, combining operational reports, line utilisation figures, and daily production summaries to identify what is working and where improvements are needed.

MAIN SEQUENCE

1.	The Owner logs into SPF-OMS and navigates to the 'Daily Summary' section.
2.	He selects a date to review and the system displays total output, total downtime, and completed batches for that day, broken down by production line.
3.	The Owner drills into a specific line to view the full detail for that day.
4.	He then navigates to the 'Production Line Utilisation' section.
5.	He selects a production line and sets the date range to the past month.
6.	The system calculates and displays utilisation as a percentage of scheduled hours versus actual output hours.
7.	The Owner switches between lines to compare utilisation across the facility.
8.	He exports the utilisation data for the selected period.
9.	The Owner then navigates to the 'Reports' section.
10.	He selects the Yield Rate report, sets the same date range, and the system compiles key figures and summary charts.
11.	He repeats for Cost per Unit and On-Time Delivery Rate reports.
12.	The Owner exports all reports as PDF files for the monthly management review.

ALTERNATIVE SEQUENCE

- If no production activity was recorded for a selected date, the system displays an empty state message.
- If shift scheduling data is incomplete for a period, the system flags the gap and calculates utilisation based on available data.
- If data for the reports period is incomplete, the system flags the gaps and generates reports with available data.
- If no data exists for a selected range, the system notifies the Owner and suggests a valid date range.
- If a line was offline for planned maintenance, the Owner can exclude those hours from the utilisation calculation.

SPECIAL REQUIREMENTS

- Daily summary must show total output, downtime, and completed batches per day, broken down by line.
- Utilisation must be expressed as a percentage of scheduled hours versus actual output hours.
- Pre-built reports must include yield rate per line, cost per unit, and on-time delivery rate.
- Reports must be filterable by date range and exportable as PDF or spreadsheet.

POST-CONDITION

POST-CONDITION The Owner has a comprehensive view of operational performance for the period, covering daily output, line utilisation, and key efficiency metrics, all available for export and internal review.
